

The materials used in solar panels, specifically cadmium telluride and lead, are safely contained within the panels and pose minimal environmental risk during normal use.

A summary of Environmental, Health and Safety issues associated with some thin film technologies like copper indium gallium diselenide (CIS/CIGS), cadmium telluride (CdTe) and ...

In conclusion, while solar panels predominantly use materials like glass and silicon that are not toxic, certain types and components contain heavy metals such as lead, cadmium, arsenic, ...

PV modules are categorized as hazardous waste if the metals that leach out during a TCLP test exceed regulatory threshold values; otherwise, they are considered non-hazardous waste. ...

Despite the fact that some states have gone so far as to ban use of these materials, there's no evidence that today's photovoltaic cells contain arsenic, germanium, hexavalent chromium ...

As global solar installations hit 450 GW capacity in Q1 2025 according to the Renewable Energy Market Monitor, arsenic telluride (As_2Te_3) panels are emerging as the dark horse of photovoltaic technology.

Table 2 presents the main results of different PV leaching studies, indicating which solar panel technology used and the value found for the hazardous chemical element, according to the ...

Arsenic and gallium are used in only high-efficiency PV modules for aerospace applications. Germanium was once used in some amorphous silicon modules that were never ...

The actual Cd concentrations in a given landfill would depend on the amount of PV panels disposed, panel design, panel fragment size, climatic conditions, landfill management and ...

DOE supports innovative research focused on overcoming the current technological and commercial barriers for cadmium telluride (CdTe) solar cells.
