

What is the difference between epoxies and solar panels?

Epoxy technology has come a long way, advancing at a much faster pace than solar technology. Epoxies offer high mechanical strength properties, superior dimensional stability and excellent adhesion to similar and dissimilar substrates.

What is epoxy and how does it work?

Epoxy is a thermosetting polymer. With two-part epoxies, the epoxide resin of one part reacts when mixed with the polyamine hardener of the other. Newer, one-part epoxy systems are pre-catalyzed and cure with heat. Epoxy technology has come a long way, advancing at a much faster pace than solar technology.

Are solar epoxies the new gee-whiz technology?

In solar applications, epoxies meet those and other unique challenges. We often think of solar as some new form of gee-whiz technology. In fact, humans have been harnessing the power of the sun since the 7th century B.C., starting off with ways to concentrate the sun's energy to light fires. Think solar water heaters are new?

How do photovoltaic cells work?

Cells are electrically connected and encapsulated to form a photovoltaic module. Sheets of glass allow light to pass while protecting the semiconductor wafers from nature's outdoor elements. Modules are then connected to each other creating a solar panel, or array.
