

How does a solar inverter work?

Most homes and appliances run on alternating current (AC). This is where the solar inverter comes in. Put simply, a solar inverter converts the DC electricity generated by your solar panels into AC electricity that can be used in your household or fed back into the power grid. Without it, all that solar energy would be essentially unusable.

Is a solar inverter a converter?

A solar inverter is really a converter, though the rules of physics say otherwise. A solar power inverter converts or inverts the direct current (DC) energy produced by a solar panel into Alternate Current (AC.) Most homes use AC rather than DC energy. DC energy is not safe to use in homes.

Do all solar power systems need a solar inverter?

All solar power systems need a solar inverter. Its main role is straightforward but crucial, changing the direct current (DC) produced by solar panels into alternating current (AC), the type of electricity that powers homes and businesses in hundreds of thousands across the USA.

How do solar panels work?

When they do, a string of solar panels forms a circuit where DC energy flows from each panel into a wiring harness that connects them all to a single inverter. The inverter changes the DC energy into AC energy. Most standard string inverters are mounted on the home, garage, or near the power meter if the house connects to the power grid. Pros--
