

Hence, this study addresses the feasibility of a solar power system based on the characteristics of South Korean solar radiation exposure to supply the required energy to a remote cellular base station.

The issues related to environmental concerns, high-power consumption, and insufficient energy-saving techniques are escalating rapidly in communication technologies.

The following discussion is based on an average daily solar radiation for South Korea of 4.0 kWh/m² and a wind speed of 4.0 m/s as a case study. However, this discussion can be extended to include ...

Following the emerging concept of green telecommunication networks, the realization of powering BS sites using sustainable solutions has started to receive significant attention. Therefore, various studies and developments have been done to help telecom operators shift away from using diesel generators as their primary power supply solution for BSs... Abstract: This paper aims to address the sustainability of power resources and environmental conditions for telecommunication base stations (BSs) at off-grid sites.

This paper aims to address both the sustainability and environmental issues for cellular base stations in off-grid sites. For cellular network operators, decreasing the operational ...

An object of the present invention is to solve such a problem, and it is easy to install and move a mobile base station, and it is possible to supply power smoothly even in places where power...
