How do I reduce the voltage from a solar panel?

There are two ways to reduce the voltage from a solar panel. Those are: 1. Connect the panel to something that requires charging; A lead-acid battery will take the energy from the solar panel, leaving it depleted so long as the panel is not in the sun. Under this example, you are literally removing the voltage from the solar panel.

What is a buck converter on a solar panel?

These are also known as Buck Converters. A buck converter reduces the output of the solar panel-- the energy flowing out of the solar panel -- to match the input requirements of the battery or device. Solar panels produce energy in DC format.

Do solar panels need a converter?

The converter is not inverting the power, simply reducing the number of volts reaching the battery. If you needed to reduce the solar panel's power for maintenance, you would not use a converter. Instead, you would attach the solar panel to a lead-acid battery and allow the battery to drain the power from the solar panel.

How many volts does a 200 watt solar panel produce?

A 200-watt solar panel produces 18 volts of energy, which is an ideal solar panel size for charging a 12-volt battery or to power a device that is also 12 volts. If you need a solar panel that produced 24 volts, it would be in the 300-watt range. There is a difference in measurement between an open and closed circuit.
