

# Solar container lithium battery energy storage safety solution

Are lithium-ion battery energy storage systems safe?

Lithium-ion battery energy storage system (BESS) has rapidly developed and widely applied due to its high energy density and high flexibility. However, the frequent occurrence of fire and explosion accidents has raised significant concerns about the safety of these systems.

How can a containerized lithium-ion battery be safe?

By developing more advanced battery management algorithms, it can conduct fault diagnosis under accurate state estimation and effectively ensure the safety of the battery operation. Thus, the operating safety and reliability of the containerized lithium-ion BESS can be ensured by the external characteristics of the batteries.

Why is battery management important in containerized lithium-ion BESS?

Battery management is crucial to the safety and reliability of containerized lithium-ion BESS. The battery management algorithm mainly involves battery state estimation, battery equalization management, and fault diagnosis.

Is a lithium-ion energy storage system based on a single-cell state estimation algorithm?

In addition, the lithium-ion energy storage system consists of many standardized battery modules. Due to inconsistencies within the battery pack and the high computational cost, it is not feasible to directly extend from the single-cell state estimation algorithm to the battery pack state estimation algorithm in practical applications.
