

Avoiding power quality problems including voltage fluctuations, harmonics, and flickers as well as unbalanced loads and reactive power usage is the major goal. Besides, the proposed method ...

Three-phase voltage source converters with strong and stable control capability are essential for grid-connected solar energy systems. The application of a quasi-newton least mean ...

The proposed control approach integrates a Lyapunov function controller (LFC) for the voltage control loop and a model predictive controller (MPC) for the current tracking control loop.

An experimental test setup using solar array simulator and a multifunctional power electronics converter has been developed for demonstration of the results. The control algorithms are ...

Ovation Green SCADA systems support grid stability and operational flexibility for any solar farm or plant type. Photovoltaic (PV) and concentrated solar power (CSP) plants have unique operational and ...

Abstract: In this work, a multifunctional control is implemented for a solar photovoltaic (PV) integrated battery energy storage (BES) system (PVBES), which operates both in the grid ...

This topic is fundamentally different from the traditional solar tracking device such as clock and the maximum power solar tracking device, such as passive solar tracking device. Combined with ...

In this paper, control algorithm for robust variable step size-least mean square (RVSS-LMS) adaptive filter is designed and put to use for solar photo voltaic (

This paper presents three different control methods for generating reference current in a multifunctional, multilevel grid-tied PV inverter for harmonic, reactive, and unbalance compensation.

This study develops six control modes for a BESS that enable it to support three solar PV farms and the host power distribution system. The BESS, the PV plants, and the distribution system ...
