

Standards for subway regenerative energy storage systems

This article investigates the feasibility of using regenerative energy from braking trains to charge electric buses in the context of New York City's (NYC) subway and electric bus networks.

With the development of urban rail transit, the energy consumption and carbon emissions of subway operation are increasing. How to reduce the energy consumption.

Abstract: In this paper, a DC microgrid solution is proposed to mitigate the high penetration levels of distributed energy resources (DERs) and electric vehicles (EVs). The microgrid is designed to ...

ABSTRACT e provides a comprehensive evaluation and comparison of currently available proper management of energy in regenerative braking subway transportation. In this article we compared the...

In this project electrical energy usage data was collected and analyzed to quantify the energy budget with respect to regenerative braking performance and potential Energy Storage System (ESS) ...

To make the RBE usage rate of the train group reach the required target, a typical problem is how to use the OESD with the minimum capacity to reduce the cost. With this consideration, this ...

Then, based on the power demand of low-voltage load in metro stations, a dual-mode power management strategy is proposed to allocate the reference power of each system according ...

We have presented a subway station energy system, with a battery recovering trains braking and smart control of the ventilations. We have investigated methods to develop and implement an Energy ...

Examples include energy management, regenerative energy, and storage. About two-thirds of the power used by the MTA is to keep our subways and trains running. To optimize these systems, the MTA will ...

On-board energy storage devices (OESD) and energy-efficient train timetabling (EETT) are considered two effective ways to improve the usage rate of regenerative braking energy (RBE) of ...
