

Sandia National Laboratories and Black & Veatch, Inc., conducted a system feasibility study to examine options for placing at Boulder City, Nevada an advanced energy storage system that can store off ...

This study attempts to derive proactive control strategies for ESS in HS/S to operate with various distribution networks.

The battery storage system has advantages over other energy storage technologies in that it has wide variety of options which provide high energy density, high efficiency, fast response, ...

The proposed project was evaluated for impacts assuming an Energy Resource (ER) interconnection service only as the BHCE load is less than the prior queued network resources.

In this section, we compare small pumped hydro storage plants with subsurface pumped energy storage horizontal wells under conditions of equal output power and total water storage capacity.

For this project, EPE needed to determine the available export/import capacity from the 60 kV substation under normal (N-0) and contingency (N-1) conditions. However, aging transmission infrastructure ...

We propose a revolutionary utilization and integration of existing technologies, including incremental improvements and innovations, for the design of the substation of the future.

Having determined the type of substation required, it follows to determine the required component equipment based on the type of substation and the specific functions the substation ...

The paper presents a methodology to assess the economic feasibility of battery energy storage systems (BESS) in electricity distribution network asset management.

We perform every step of the design process, from feasibility studies and site assessments through physical design, protection, controls, and programming.
