

China has rapidly become a major auto exporter, but tariffs have kept cheap Chinese EVs out of the U.S. market -- so far.

In both July and August of 2024, for example, industry data shows that over half of total automotive sales in China were electric or hybrid. The U.S., quite simply, is playing catch-up.

This article presents a comparative analysis of EVs in China, Europe, and the United States, offering valuable insights into the evolving landscape of sustainable transportation.

The ongoing US-China trade war is set to negatively impact the US EV market, particularly due to the heavy dependence on Chinese imports like lithium-ion batteries.

In the U.S., a record one in ten cars sold in 2024 was electric, a share set to double by 2030. Despite making strides in EV technology, the U.S. remains far behind China in terms of production and sales. ...

The Chinese automotive industry has become the largest exporter of vehicles globally since 2023 and has been increasingly bringing electric models around the globe. The U.S. auto ...

This year, up to 45% of the cars on Chinese roads could be electric vehicles, compared with 25% in Europe and about 11% in the U.S., according to a report by the International Energy...

Chinese EV exports to the United States did not increase significantly during 2018-23, but competition in third-country markets negatively affected U.S. EV exports during this period.

It is commonly said that history repeats itself, and the rise of Chinese electric vehicles (EVs) and their potential impact on the U.S. car market rings a bell.

Electric car sales in China increased by almost 40% year-on-year in 2024, further driving up China's share of global electric car sales. In 2021, China accounted for half of global electric car sales; this ...
