

To drive recycling forward, the study proposes a circular economy model for PV waste management, advocating for policy harmonization, industry-led recycling incentives, and technological innovations ...

The composition varies between crystalline-silicon and thin-film modules, but most materials have high recycling potential when handled by a specialized facility. Glass is the largest recoverable ...

This review aims to provide a comprehensive understanding of the current state of silicon PV panel recycling, identify key areas for future research, and propose strategies to overcome ...

This review addresses the growing need for the efficient recycling of crystalline silicon photovoltaic modules (PVMs), in the context of global solar energy adoption and the impending ...

Here, a sustainable strategy is proposed to upcycle photovoltaic silicon waste (PV-WSi) into high-performance anode materials via interface-engineered hierarchical structuring. The Si/TiO₂ ...

The key aim of this study is to highlight an updated review of the waste generation of solar panels and a sketch of the present status of recovery efforts, policies on solar panel EOL ...

In this Review, we discuss the current PV recycling strategies, covering liberation of materials and metal recovery approaches, for both pilot trials and laboratory-scale demonstrations.

The expansion of photovoltaic power plants, low efficiency of module production processes resulting in waste generation during production, as well as the increase in waste from ...

This increase presents significant environmental challenges due to hazardous elements like lead and tin in PV modules, necessitating sustainable waste management solutions.

Mass installation of silicon-based photovoltaic (PV) panels exhibited a socioenvironmental threat to the biosphere, i.e., the electronic waste (e-waste) from PV panels that is projected to reach ...
