

Wind power generation doesn't rotate even when there is wind

As of 2024, 12% of operational wind turbines experience unexpected rotation stoppages annually, costing the industry \$2.3 billion in lost energy production. Let's break down what's really ...

Bottom line: Wind turbines don't always spin--and in Texas, it's often not because the wind isn't blowing. Transmission constraints and grid congestion are preventing clean, low-cost wind ...

Discover why wind turbines not turn and what we can do to keep them spinning for a sustainable energy future.

There are several reasons why wind turbines may not turn: 1) there is no wind, 2) there is wind but the wind speed is too low, 3) the wind is too strong, and 4) the turbine is not spinning. ...

Why do all wind turbines spin in the same direction? The reason for this is due to the nocturnal behavior of the boundary layer, which is the lowest few hundred meters of the atmosphere. ...

Curious about how wind turbines work when there's no wind? This article explains how turbines generate electricity, even when it's not windy outside!

Sometimes at ground level, it might feel like there is no wind, yet you can still see wind turbines rotating. This is because at higher altitudes, the wind speed increases.

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...

However, a common sight that often raises questions is that of stationary wind turbines. Why Are The Wind Turbines Not Turning? This question is not just a matter of idle curiosity; it goes ...

For this edition of Scrub Hub, we examine why adjacent wind turbines don't always appear to be operating at the same time.
