

Solar panels and wind turbines often come to mind when we think of renewable energy. But another powerhouse in green energy is working quietly in the background: biomass power ...

Recycling challenges are being proactively addressed to make wind energy greener and, as shown above, the carbon footprint of wind power is significantly less than most other energy sources.

Part 1 (this report) establishes a baseline by assessing existing U.S. recycling infrastructure and determining whether the U.S. economy has the necessary technologies to disassemble and recycle ...

The Wind Energy Technologies Office (WETO) is working with researchers across industry, academia, and DOE national laboratories to focus on wind blade recycling and enable ...

Holcim GmbH's L&#228;gerdorf cement plant in Schleswig-Holstein recently recycled shredded wind turbine blades as substitute fuel. This thermal recycling process can reduce CO2 emissions by ...

The proper disposal, recycling and reuse of such parts are essential to preserve the environmental advantages of wind power since decommissioned turbines generate substantial waste.

The wind industry is working to help advance sustainable disposal solutions through advanced recycling and repurposing methods while minimizing waste-- maximizing the environmental benefits of wind ...

Researchers at the National Renewable Energy Laboratory have developed what they say is a turbine blade made from plant material that can be recycled. The new substance is made ...

The new facility is expected to process approximately 200 metric tons of blade waste (equivalent to 5,000-7,000 fiberglass wind turbine blades) per year, depending on blade size and generation. The ...

In the electric power sector, several power plants burn mostly wood to generate electricity, and some coal-burning power plants burn wood chips with coal to reduce sulfur dioxide emissions.
